

Every foundation needs a base-grounding: All foundations shall be connected in series with grounding-steel.(min. 16qmm)

It must be possible to connect the base-grounding with the later mounted steel pole.

The base-grounding should not hinder the installation of the steel pole.

For the subsequent electric installation, an empty conduit (ø 32mm/pressure resistant) must be installed at each foundation. The empty conduit must protrude approx 10cm from the centre of each foundation. The empty conduit needs sufficient wire for pulling.
